

Description

The Whisper Walls WhisperTrack™ polymer track, or “stretching system”, is a key component to the Whisper Walls site-fabricated panels. The WhisperTrack™ creates a cavity for core material to be installed that can absorb, reflect, diffuse or be a tackable surface as required. The track is cut in-the-field according to the site conditions and the panel layouts specified. The track securely grips the chosen fabric allowing it to be stretched over the core material creating the tailored appearance and performance that are hallmarks of a Whisper Walls installation.

While the standard Whisper Walls WhisperTrack™ profiles are made of PVC due to their high-quality attributes, we have developed a line of PVC-Free track profiles to meet the demands of the design community when a PVC-Free interior environment is specified. WhisperTrack™ PVC-Free alternative stretching tracks have the same high exacting standards as the traditional PVC for constructing a Whisper Walls site-fabricated panel system.

Properties

100% PVC-Free

Class A fire rated – Tested as a stretched fabric panel assembly according to ASTM-E84 and ASTM-E2573 fire test standards.

Currently available in 1” Square Edge system with perimeter, midwall, inside corner and outside corner profiles.
